Education

TITLE

VAAHANSETU

A REAL-TIME SMART BOOKING PLATFORM CONNECTING
CUSTOMERS WITH GOODS VEHICLE SERVICES.

THE PROBLEM

- Vehicle owners wait for work.
- Customers struggle to find suitable vehicles.
- The process is slow, inefficient, and costly due to middlemen.

ABSTRACT

VaahanSetu is a smart online platform that connects customers directly with nearby independent goods vehicle owners, eliminating the need for middlemen. It matches transport requests based on the size, type, and location of goods, enabling quick, affordable bookings. With real-time matching and instant access, VaahanSetu helps vehicle owners get more work while providing individuals and businesses with faster, cost-effective transport solutions — all in one unified system.

EXISTING SYSTEM

- Current ride/goods matching systems (e.g., Uber, Ola, logistics apps) rely on centralized cloud servers for data processing and decision-making.
- Matching decisions are based mainly on location proximity and availability, ignoring personal and contextual factors such as user profile, load type, or preferences.
- Latency and privacy issues occur due to dependence on the central cloud and constant data uploads.
- No mechanism for collaborative learning across multiple nodes — each system learns independently, leading to poor adaptability in new regions.

Limitations:

- High communication delay and bandwidth consumption
- Limited personalization and context awareness
- Data privacy concerns
- Centralized model with low scalability

PROPOSED SYSTEM

FEDERATED EDGE-ASSISTED CONTEXT-AWARE MATCHING ALGORITHM (FECAMA)

- A Federated Edge-Assisted Context-Aware Matching Algorithm (FECAMA) that integrates contextual intelligence, edge computing, and federated learning to provide real-time, privacy-preserving, and adaptive user–vehicle matching.

System Highlights:

- Context-Aware Inputs: Utilizes user data (age, gender), trip details (pickup/drop), and vehicle type for personalized matching.
- Edge-Assisted Processing: Initial data processing and inference occur on edge nodes near users for low latency.
- Federated Learning Integration: Each edge node trains locally and shares model updates (not raw data) with the global server for aggregation.
- Adaptive Matching Model: Continuously improves through collaborative learning while maintaining user privacy.

Advantages:

- Faster and intelligent matching decisions
- Preserves privacy via federated learning
- Reduces communication cost and delay
- Personalized, scalable, and real-time system

OUR SOLUTION: **VAAHANSETU**

THE ADVANTAGE: **NO MIDDLEMEN**

Choose the most efficient and cost-effective transportation model

Traditional
Way

Involves
middlemen,
leading to higher
costs and delays

VS

VaahanSetu
Way

Connects
customers and
drivers directly,
reducing costs and
increasing earnings

KEY FEATURES

OBJECTIVES

Seamless Platform

Core goal of direct user connection

Increased Driver Earnings

Benefit for drivers

Reduced Idle Time

Efficiency for drivers

Affordable Transport

Benefit for customers

Eliminate Middlemen

Efficiency improvement

HOW IT WORKS ?

Post Request

Customer enters cargo and location details

Get Matched

Platform finds the nearest, best-fit driver

Driver Accepts

Booking is confirmed instantly

Track & Complete

Customer tracks the trip to completion

Smart Real-Time Booking Platform

Software Requirements

Microservices Architecture: Modules and Descriptions

LITERATURE REVIEW

S. No	Authors Name	Title of the Paper	Year	Methodology	Advantages	Disadvantages
1	R Dintén, S García, M Zorrilla	Fleet management systems in Logistics 4.0 era: a real time distributed and scalable architectural proposal	2023	Exploring recent studies on Smart Transportation Systems with IoT and cloud integration, then examining distributed and scalable big data architectures relevant to real-time logistics platforms.	The proposed architecture supports scalable, near real-time processing of IoT data, enabling faster decision-making and adaptability to increasing system demands. It enhances system availability by providing redundancy and simplifies maintenance by decoupling business logic from databases.	Implementing this solution requires managing increased complexity, including a steep learning curve due to new programming paradigms and the need for precise orchestration across multiple technologies. Additionally, ensuring compatibility, security, and version control in a distributed environment presents ongoing challenges.
2	A Kotsialos, P Vassilakopoulou	Fleet management enterprise systems and traffic control synergies: a literature review and research agenda	2023	A systematic literature review was conducted using Scopus, guided by Kitchenham’s protocols and enhanced with natural language processing topic modeling (Latent Dirichlet Allocation) to identify key research themes and gaps related to synergies between fleet management and traffic control systems.	The collaboration between fleet management and traffic control systems can significantly improve operational efficiency, safety, and environmental performance by enabling real-time information sharing, better traffic management, and optimized fleet operations.	Research on real-time coordination and integration between fleet management and traffic control is limited, with existing solutions largely conceptual, facing challenges in information sharing, resource pooling, and detailed coordination mechanisms.

S. No	Authors Name	Title of the Paper	Year	Methodology	Advantages	Disadvantages
3	H Dui, S Zhang, M Liu, X Dong, G Bai	IoT-enabled real-time traffic monitoring and control management for intelligent transportation systems	2024	The paper proposes a three-layer IoT-based ITS architecture—perception, communication, and application layers—that collects real-time traffic data from vehicles and roadside units, processes it centrally at a traffic management center, and uses coordinated control strategies to alleviate congestion considering vehicle behaviors and network dynamics.	The system improves traffic flow and reduces congestion by dynamically controlling vehicle routes using real-time IoT data and considers congestion propagation and driver route choices to optimize overall transportation efficiency	Challenges include managing non-compliant vehicles that do not follow control instructions, which can cause unpredictable congestion spread and longer recovery times; infrastructural and communication complexities also exist in coordinating diverse IoT devices and ensuring data reliability
4	Y Yin, H Wang, X Deng	Real-time logistics transport emission monitoring-integrating artificial intelligence and internet of things	2024	The study develops a real-time emissions monitoring system combining IoT sensor data from vehicles with AI models. It uses ensemble learning of gradient-boosting algorithms on sensor data from onboard diagnostics, temperature, and humidity sensors to predict CO2 emissions accurately without physical gas analyzers.	The approach provides a cost-effective and highly accurate method for real-time monitoring of logistics transport emissions. It enables precise emission predictions validated by a strong correlation between predicted and actual CO2 levels, supporting better environmental footprint assessment.	Challenges include the integration and management of diverse IoT sensors under varying environmental and road conditions. The system relies on the quality and consistency of sensor data, which may affect prediction accuracy in complex logistics operations.

S. No	Authors Name	Title of the Paper	Year	Methodology	Advantages	Disadvantages
5	M Elassy, M Al-Hattab, M Takruri, S Badawi	Intelligent transportation systems for sustainable smart cities	2024	The paper reviews ITS technologies like Vehicular Ad-hoc Networks (VANETs), Intelligent Traffic Lights (ITL), Virtual Traffic Lights (VTL), and mobility prediction, supported by advanced communication systems including IEEE protocols, 5G, and IoT sensors. It examines their roles in optimizing traffic flow, safety, and reducing emissions in smart cities.	ITS improves traffic efficiency by enabling real-time traffic management, reducing congestion and emissions, enhancing safety through vehicle-to-everything (V2X) communication, and supporting sustainability goals in urban transportation.	Challenges include cybersecurity threats to vehicular networks, data privacy concerns, complexity in integrating diverse systems, and maintaining reliable, low-latency communication across large-scale deployments.
6	A Hazarika, N Choudhury, MM Nasralla, SBA Khattak, IU Rehman	Edge ML technique for smart traffic management in intelligent transportation systems	2024	The system uses an optimized YOLOv3 model on edge devices to count vehicles at intersections in real time. It dynamically adjusts traffic light timings based on detected traffic density and communicates delays between junctions using low-power protocols IEEE 802.15.4 DSME and LoRaWAN.	This method reduces traffic congestion and waiting time by adapting signals to real conditions. Edge computing lowers latency and bandwidth use. Low-power wireless communication extends device battery life. It also prioritizes emergency vehicles for faster passage.	Accuracy depends on camera quality and placement. Edge devices have limited processing power. Wireless signals may face interference. Scaling to many junctions may be complex. Lack of cloud integration may limit broader city analytics.

S. No	Authors Name	Title of the Paper	Year	Methodology	Advantages	Disadvantages
7	R Zhang, J Mao, H Wang, B Li, X Cheng, L Yang	A survey on federated learning in intelligent transportation systems	2024	The study utilizes Federated Learning (FL) to train machine learning models on decentralized data generated by vehicles and infrastructure in Intelligent Transportation Systems (ITS). FL enables local training on edge devices while aggregating model updates centrally, preserving data privacy and reducing communication overhead.	FL enhances privacy as raw data never leaves local devices, addressing data sharing and confidentiality concerns. It improves real-time processing by distributing computation across edge devices, reducing latency. FL also enables collaboration among multiple organizations without exposing sensitive data, fostering scalable and efficient ITS solutions.	Challenges in FL include high communication costs due to frequent model updates and heterogeneity in device capabilities causing slow or imbalanced training. Security risks exist from malicious participants potentially poisoning the aggregated model. Additionally, protecting against inference attacks and ensuring regulatory compliance remain complex issues.
8	X Zhou, W Liang, A Kawai, K Fueda, J She, KIK Wang	Adaptive segmentation enhanced asynchronous federated learning for sustainable intelligent transportation systems	2024	The paper proposes an Adaptive Segmentation Enhanced Asynchronous Federated Learning (AS-AFL) model for ITS, which groups vehicles with similar network and device characteristics using a meta-learning-based segmentation. Within groups, synchronous federated learning updates models via peer-to-peer exchanges, while across groups asynchronous updates enable scalable, reliable learning without a central server.	The paper proposes an Adaptive Segmentation Enhanced Asynchronous Federated Learning (AS-AFL) model for ITS, which groups vehicles with similar network and device characteristics using a meta-learning-based segmentation. Within groups, synchronous federated learning updates models via peer-to-peer exchanges, while across groups asynchronous updates enable scalable, reliable learning without a central server.	Challenges include the complexity of dynamically segmenting clients based on varied attributes and ensuring accurate group formation. The approach requires efficient peer-to-peer communication protocols and may face scalability issues in extremely large networks. Also, asynchronous updates might introduce inconsistencies affecting model convergence.

S. No	Authors Name	Title of the Paper	Year	Methodology	Advantages	Disadvantages
9	K Belkacem	Integrating Edge and Cloud Computing for Efficient Big Data Processing in IoT Environments: Enhancing Smart City Applications with Fog Computing	2024	The approach combines edge, fog, and cloud layers to manage IoT data processing efficiently. Edge devices perform local data preprocessing and lightweight analytics to reduce latency. Fog nodes act as intermediaries, handling more complex processing closer to data sources, while the cloud provides large-scale storage and heavy computational power for deep analytics.	This layered architecture balances latency reduction, bandwidth savings, and powerful analytics. It enables context-aware decision-making near the source of data and offloads intensive tasks to the cloud, achieving scalability. Containerization and orchestration techniques allow flexible deployment and dynamic resource allocation, improving system resilience and adaptability.	Challenges include complex task allocation and scheduling across heterogeneous networks and devices, managing security and privacy across distributed nodes, and handling variable network conditions. Ensuring seamless coordination between layers and mitigating data redundancy or communication bottlenecks add to design complexity.
10	I Afzal, Z Ahmad, A Algarni	A Latency-Aware and Fault-Tolerant Framework for Resource Scheduling and Data Management in Fog-Enabled Smart City Transportation Systems.	2025	The FORD framework utilizes fog computing by deploying computational tasks to nearby fog nodes and cloud resources. It applies latency-aware resource scheduling to assign tasks to the closest available nodes, minimizing execution time. A fault-tolerant mechanism ensures that tasks that fail at one node are rescheduled elsewhere to guarantee completion, with data securely stored in the cloud.	This framework reduces latency by processing data closer to its source and balances workload between fog and cloud for efficiency. It enhances reliability through fault tolerance, preventing task failures from impacting system performance. The approach supports high data integrity and seamless integration of fog and cloud, making it suited for time-sensitive smart city applications.	Challenges include the complexity of dynamically scheduling tasks across heterogeneous fog and cloud nodes. Fault tolerance mechanisms add overhead and may increase communication costs. Ensuring security and privacy throughout distributed layers is non-trivial, especially when managing massive sensor-generated data in real time.

LOGISTICS REIMAGINED. MOBILITY SIMPLIFIED.

The Digital Bridge for India's Transportation Network.

System Results and Discussion

Successful Matching

System accurately matches customers with nearby vehicles, reducing waiting time and improving booking efficiency.

Real-Time Tracking

Live vehicle tracking using Leaflet.js and SocketIO provides smooth updates without page refresh, enhancing user experience.

Booking & Payment

Seamless booking workflow from request to confirmation with secure payments integrated via Razorpay, leading to faster transaction processing.

User Experience

Easy registration and login system with a simple and intuitive UI for both customers and drivers, increasing engagement.

AI Matching

Better vehicle allocation based on load and location reduces idle time for drivers and improves overall system efficiency.

System Performance

Low response time for booking and matching, efficient database handling using MySQL, and scalable architecture for multiple users.

Discussion

The system eliminates middlemen, reducing cost and delays, while real-time communication improves coordination.

CONCLUSION

The VaahanSetu platform successfully provides a real-time, efficient, and user-friendly solution for connecting customers with goods vehicle owners. By integrating smart matching, live tracking, and secure payment systems, the platform reduces delays, eliminates middlemen, and improves overall logistics efficiency.

FUTURE ENHANCEMENTS

In future, the system can be enhanced by adding advanced AI-based demand prediction, mobile app support, and multi-language features for wider accessibility. Further improvements may include route optimization, real-time traffic integration, and scaling the platform to support nationwide logistics operations.

RCSM 2025: Acceptance of Paper ID 1198

1 message

Microsoft CMT <noreply@msr-cmt.org>

11 November 2025 at 23:57

To: Pantala Anusha <pantalaanusha93@gmail.com>

Dear Pantala Anusha,

Greetings!

Thank you for submitting your research article to the 1st IEEE International conference on Recent Trends in Computing and Smart Mobility Conference (RCSM 2025), which will be held in hybrid mode on Dec 5-6, 2025, at MANIT Bhopal, India.

We are pleased to inform you that based on reviewers' comments, your paper titled "Quantum-Edge AI Framework for Real-Time Vehicle-Cargo Matching in Intelligent Transportation Systems" has been accepted for presentation during RCSM 2025, and publication in the proceedings to be published in IEEE Xplore, subject to the condition that you submit a revised version as per the comments, shared with the corresponding author. It is also required that you prepare a response to each comment from the reviewer and upload it as a separate file along with the revised paper. IEEE XPLORE is indexed with the world's leading Abstracting & Indexing (A&I) databases, including ISI / SCOPUS/ DBLP/ EI-Compendex / Google Scholar.

The similarity index in the final paper must be less than 20%. Please note that high plagiarism, AI-generated text, and any kind of multiple submissions of this paper to other conferences or journals will lead to rejection at any stage.

Please Note that Conference proceedings that meet IEEE quality review standards will be eligible for inclusion in the IEEE Xplore Digital Library. IEEE reserves the right not to publish any proceedings that do not meet these standards.
